What Is Financials Approval Management?

The engine that routes Payables, GL, and Expenses transactions to approvers

Oracle Fusion Financials routes Payables invoices, GL journals, expense reports, and Supplier Portal invoice requests through Approval Management Extensions (AMX), built on the Oracle BPM / SOA Suite. Each transaction type has its own predefined workflow task — e.g. FinApInvoiceApproval for Payables, FinExmWorkflowExpenseApproval for Expenses — administered by a Financial Application Administrator (FUN_FINANCIAL_APPLICATION_ADMINISTRATOR).

Core Financials approval workflows

Two Ways to Configure Financials Approval Rules

Both are launched from Setup & Maintenance (FSM) — they differ in how the rules themselves are authored

Simplified Spreadsheet Rules

FSM: Manage Workflow Rules in Spreadsheet

- Excel-based rule templates — download, define conditions, generate & upload the rule file
- Available only for Payables Invoice Approval and GL Journal Approval workflows
- Business-user friendly: name rule blocks, initiate approvals in parallel, use Lists for custom conditions
- Once adopted for a workflow, future changes must continue through the spreadsheet
- Existing BPM rules can be downloaded and imported into the template to migrate

BPM Worklist (AMX)

FSM: Manage Task Configuration for Financials

- Full Approval Management Extensions rules engine, configured directly in BPM Worklist
- Required for Expenses and Supplier Portal Invoice Request Approval Rules
- Needed for any condition logic the spreadsheet templates cannot express
- Requires Financial Application Administrator role to access Task Configuration
- Supports multiple stages, participants, and advanced routing per workflow

Unlike Procurement's simplified FSM approval pages, Financials approvals are fundamentally BPM/AMX-based — the spreadsheet is a simplified authoring layer on top of BPM, not a separate rules engine.

Approval Routing Types in Financials

How a participant's approver list is notified and resolved

List Builders — how the approver list is generated

Choosing the Right Approach

Decision guide and implementation best practices for Financials

Use Spreadsheet Rules when...

- Configuring Payables Invoice or GL Journal Approval
- Rules are amount / attribute driven and finance ops should self-maintain
- You want named, reusable rule blocks for auditability

Use BPM Worklist when...

- Configuring Expenses or Supplier Portal Invoice Request Approval
- Conditions exceed what spreadsheet templates support (custom DFFs, multi-attribute)
- Multi-stage, mixed serial + parallel routing is required

Implementation Best Practices

- 1 Confirm which Financials workflows support spreadsheet configuration before choosing a method
- 2 Download existing BPM rules and import them into the spreadsheet template before switching methods
- 3 Use parallel rule sets (cost center, project manager) to speed multi-stakeholder Expense approvals
- 4 Use serial, job-level escalation for high-value Payables invoices and GL journals
- 5 Test with sample transactions and confirm Financial Application Administrator access before go-live
