What Is HCM Approval Management?

The engine that routes HR transactions through manager and stakeholder review

Oracle Fusion HCM routes worker transactions — hires, promotions, transfers, terminations, absence requests, and more — through Approval Management Extensions (AMX), built on the Oracle BPM / SOA Suite. Rules are administered through Manage Task Configurations for Human Capital Management, which opens the BPM Worklist. In most cases the first- and second-level manager of the person who submits the transaction must approve it.

Core HCM approval workflows

Two Ways to Configure HCM Approval Rules

Both are launched from Setup & Maintenance (FSM) — they differ in how the rules themselves are authored

Manage Approval Rules & Notifications

FSM-launched simplified graphical interface

- Recommended specifically for Hire an Employee, Promote, Transfer, and Terminate
- Arrange approvers in order, define rules per approver, and submit — no BPM expertise needed
- Works in conjunction with BPM Worklist, which still holds notification and escalation settings
- Policy changes take effect immediately for new submissions; in-flight approvals keep the prior policy
- Predefined rules exist for many Global HR tasks (typically 1st- and 2nd-level manager)

BPM Worklist (AMX)

Manage Task Configurations for Human Capital Management

- Full Approval Management Extensions rules engine for every HCM task
- Required for Absence, Performance, Compensation, Talent, and any task outside Hire/Promote/Transfer/Terminate
- Configures notification timing, task content access, escalation, and error handling
- Needed for payload-attribute-based conditions beyond the simplified UI's scope
- Used to set up Approval Groups and Areas of Responsibility (AOR)

Like Financials, HCM's simplified interface sits on top of the same BPM/AMX engine — only four core tasks get graphical rule entry; every other HCM approval is configured directly in BPM Worklist.

Approval Routing Types in HCM

How a participant's approver list is notified and resolved

SERIAL

Approvers notified one at a time — the default: the 1st-level manager approves, then the 2nd-level manager, in sequence.

PARALLEL

All approval group members notified at once — e.g. a compensation review board that must weigh in together.

FYI

Notify-only participant — e.g. informing an HR partner of a transfer without requiring their action.

AUTO ACTION

Rule-driven auto-approval — e.g. an HR-initiated transaction can bypass manager approval automatically.

List Builders — how the approver list is generated

1

Supervisory Hierarchy

1st- and 2nd-level manager chain from the worker

2

Position Hierarchy

Routes based on the position relationships defined in HCM

3

Approval Groups

Predefined set of users notified together in parallel

4

Area of Responsibility

Routes to the HR partner assigned to the worker (AOR)

5

Payload Attributes

Custom data points, e.g. request originator or leave type

Choosing the Right Approach

Decision guide and implementation best practices for HCM

Use Simplified Rules UI when...

- Configuring Hire, Promote, Transfer, or Terminate
- Standard sequential manager approval fits the business need
- HR operations should self-maintain approver order and rules

Use BPM Worklist when...

- Configuring Absence, Performance, Compensation, or Talent tasks
- Payload-attribute conditions or custom escalation are required
- Approval groups or Areas of Responsibility need to be set up

Implementation Best Practices

- 1 Define Areas of Responsibility before configuring HR-partner-based routing
- 2 Use payload attributes to auto-approve HR-initiated transactions and cut approver noise
- 3 Use approval groups for parallel review where multiple stakeholders must weigh in together
- 4 Validate predefined 1st- and 2nd-level manager rules against the live org hierarchy before go-live
- 5 Remember policy changes apply prospectively — in-flight approvals keep the prior policy
